Conteúdo

1 Um Neurônio

Versão do algoritmo Perceptron, com 1 neurônio artificial.

ENTRADA:

$$\left\{x_j\in\mathbb{R}^m,\quad t_j\in\{-1,1\},\quad j=1,...,n\right\},\quad \epsilon>0,\quad 0<\eta\leq 1,\quad \text{maxit}=1e3.$$

INÍCIO

$$\begin{cases} w = 0_{1 \times n} \\ E = 1_{1 \times n} \\ j = 0 \\ \theta = 0 \\ \text{count} = 0 \end{cases}$$

WHILE(count < maxit)

```
\begin{aligned} & \operatorname{count} + + \\ & \mathbf{j} + + \\ & \operatorname{IF}(\mathbf{j} == \mathbf{n} + 1) \\ & & \operatorname{break} \end{aligned} & E_j = t_j - \operatorname{sign}\left(\left\langle [x_j, -1], \ [w, \theta] \right\rangle\right) \\ & \operatorname{IF}(|E_j| < \epsilon) \\ & & \operatorname{continue} \end{aligned} & [w, \theta] = [w, \theta] + \eta E_j[x_j, -1] \\ & \mathbf{j} = 0 \end{aligned}
```
